

POWERING HEALTHCARE

PHC Center Ghumballi

National Rural Health Mission (NHM) was launched in the year 2005 to strengthen the Rural Public Health System by providing effective health care to the rural populace throughout the country.

One of the key infrastructure gaps is unreliable energy availability. As of 2015, nearly 35 million citizens in rural India rely on PHCs for primary health services not connected to the grid, while an even greater number of health facilities face irregular power supply. In the absence of electricity and reliable energy for heating, services catered by health institutions such as institutional deliveries, pediatric emergencies, and administering of vaccines get severely affected. Energy access in health centres is also imperative as a means to facilitate communication services, tele-health applications and to retain skilled health workers.

SELCO adopts a two-pronged approach to the energy-health nexus: energy independence and energy efficiency. SELCO takes care of the complete installation as per the standards and is responsible for addressing any system related inquiry. Health Centres will be serviced for the annual maintenance service twice every year for the upkeep of the DRE system. SELCO powers health care units at different levels- Primary Health Centre (PHC), Sub-Centre and Community Health Centres (CHC).
